We are interested here in questions related to the **maximal regularity** of solutions of **elliptic** problems with **Dirichlet** or **Neumann** boundary condition (see ([1]). For the last 40 years, many works have been concerned with questions when Ω is a **Lipschitz domain**. Some of them contain incorrect results that are corrected in the present work.

We give here new proofs and some complements for the case of the **Laplacian** (see [3]), the **Bilaplacian** ([2] and [6]) and the operator $\operatorname{div}(A\nabla)$ (see ([5]), when **A** is a matrix or a function. And we extend this study to obtain other regularity results for domains having an adequate regularity. We give also new results for the **Dirichlet-to-Neumann** operator for Laplacian and Bilaplacian.

Using the duality method, we can then revisit the work of Lions-Magenes [4], concerning the so-called **very weak solutions**, when the data are less regular.
